

THE AVALANCHE HAZARD WILL BE HIGH

Avalanche Hazard Forecast for Sunday 23/02/2014

Avalanche Problems

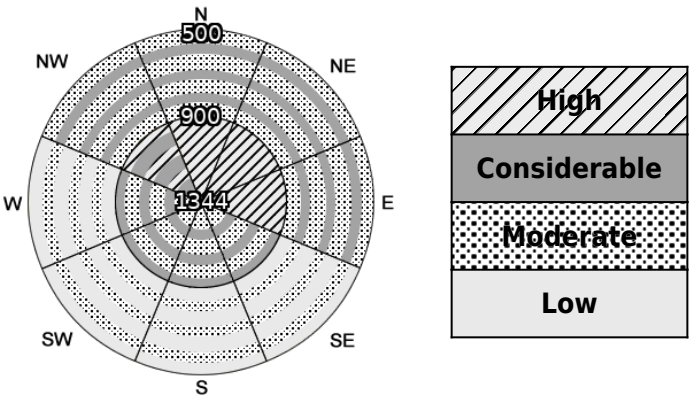

Wet Snow

Cornices

Forecast Snow Stability & Avalanche Hazard

Widespread wet snow instabilities will develop on many aspects as the freezing level rises. Wet snow avalanches will occur mainly on steep North, North-East and East aspects above 900m. Stability will also be poor on other aspects where significant accumulations of fresh snow exist. Avalanche debris runout could affect lower elevations. The avalanche hazard will be High

Forecast Weather Influences

Heavy rain is expected at all levels with the freezing level above the summits. Strong to gale-force South-South-West winds.

Comments

A period of high instability is expected during the thaw. The snowpack should start to consolidate later on Sunday afternoon
