

THE AVALANCHE HAZARD WILL BE CONSIDERABLE

Avalanche Hazard Forecast for Wednesday 05/03/2014

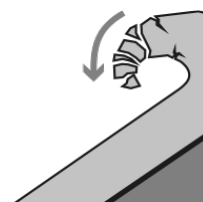

Avalanche Problems

Wind Slab

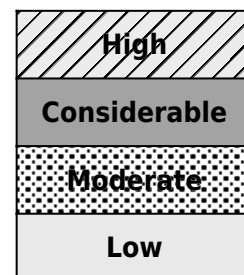

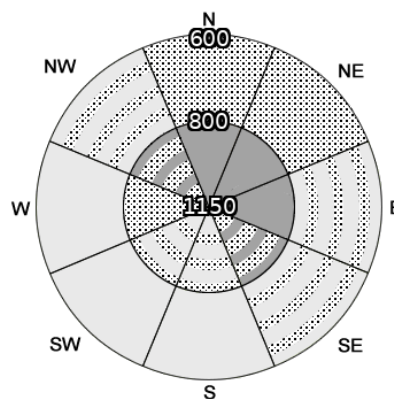

Wet Snow

Cornices

Forecast Snow Stability & Avalanche Hazard

Deep windslab will mostly be found in sheltered locations on North-West through North-East to South-East aspects above 800 metres. Stability will become increasingly poor as the freezing level rises to above the summits and avalanches are likely. Stability will also be affected on steeper terrain on other aspects and at lower altitudes. Large cornices exist over many aspects and will be prone to collapse. The avalanche hazard will be Considerable.

Forecast Weather Influences

New precipitation, will initially fall as snow but as the freezing level rises to above most summits it will fall as rain at lower levels. Winds will be very strong, mostly from the South-West.

Comments

Freezing levels rising throughout the day. Cornices prone to collapse.
