

THE AVALANCHE HAZARD WILL BE CONSIDERABLE

Avalanche Hazard Forecast for Wednesday 05/03/2014

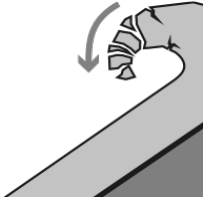

Avalanche Problems

Wind Slab

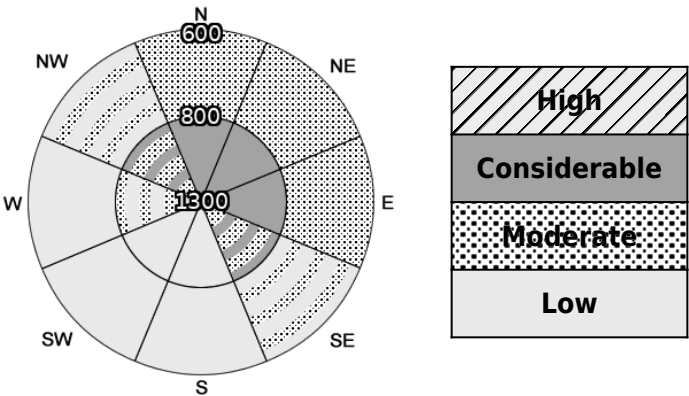

Persistent Weak Layers

Cornices

Forecast Snow Stability & Avalanche Hazard

Poorly bonded windslab will continue to affect Northerly to Easterly aspects above 800 metres. This will become more unstable during the rise in temperature and avalanches are likely. Cornices will weaken and be prone to collapse. Instabilities will exist on other aspects due to cross loading. Wind exposed areas will be mostly scoured and stable. The avalanche hazard will be Considerable.

Forecast Weather Influences

Moderate West-South-West winds overnight with a short period of light snowfall. During the dry South-West winds will increase to strong. The freezing level will progressively rise to around summit levels by the end of the day.

Comments

Freezing level will steadily rise through the afternoon. Very large cornices overhanging corries.
