

THE AVALANCHE HAZARD WILL BE MODERATE

Avalanche Hazard Forecast for Wednesday 12/03/2014

Avalanche Problems

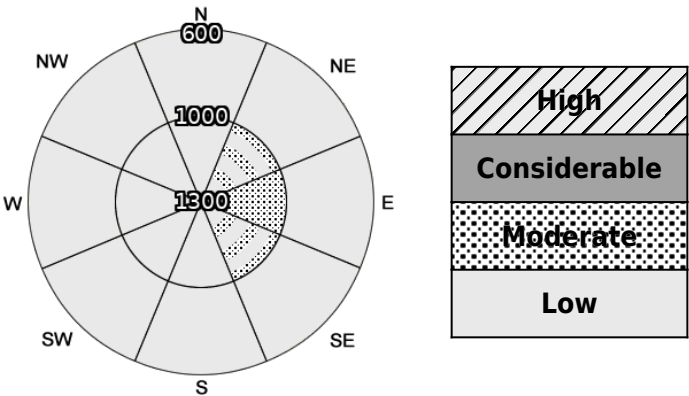

Persistent Weak Layers

Cornices

Forecast Snow Stability & Avalanche Hazard

The snowpack will generally be well bonded and stable throughout. Some instabilities will persist in very isolated locations where the windslab achieves sufficient depth on North-East to South-East aspects above 1000 metres with steep convex terrain, corrie rims and gully exits most affected. Large cornices will be prone to collapse and debris will run long distances. Surface instabilities will occur on sun affected slopes. The avalanche hazard will be Moderate

Forecast Weather Influences

Winds will be light South-Westerly at summit levels. Dry and clear with the freezing level at 1200 metres. A very warm day.

Comments

Cornices are weak and liable to collapse, debris will run to corrie floors. Sunny and warm conditions
