

THE AVALANCHE HAZARD WILL BE CONSIDERABLE

Avalanche Hazard Forecast for Wednesday 26/03/2014

Avalanche Problems

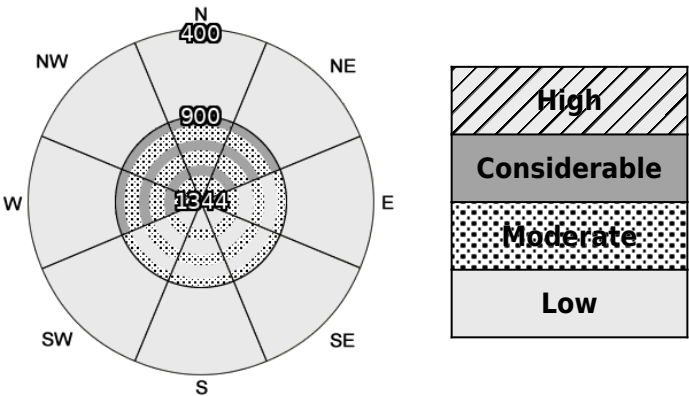

Wet Snow

Cornices

Forecast Snow Stability & Avalanche Hazard

The snowpack will gradually consolidate at most levels. Localised areas on instability will be present on many steep aspects above 900m. These will be wet snow instabilities below 1100m. Elsewhere, snowpack stability will be generally good. Cornices will become increasingly unstable and prone to collapse especially at lower elevations. The avalanche hazard will be Considerable

Forecast Weather Influences

Some light snow showers are expected over the summits, although no significant fresh accumulations. Winds will be generally light. The freezing level will be around 1100m.

Comments

An increasing hazard from collapsing cornices, especially below 1100m, due to warmer temperatures
