

THE AVALANCHE HAZARD WILL BE MODERATE

Avalanche Hazard Forecast for Saturday 29/03/2014

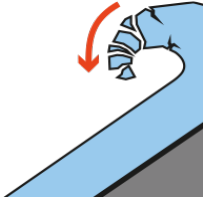

Avalanche Problems

Wind Slab

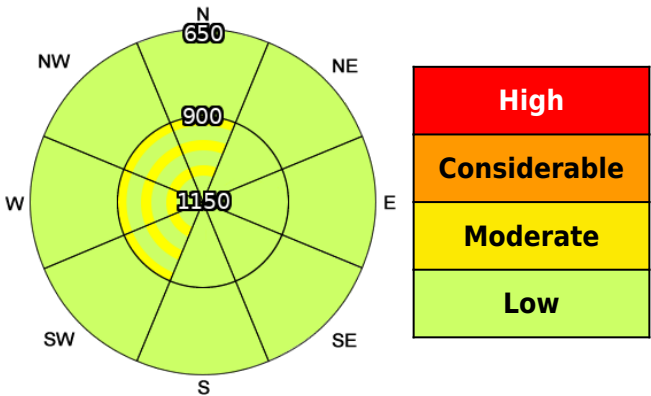

Persistent Weak Layers

Cornices

Forecast Snow Stability & Avalanche Hazard

Drifting snow will maintain the instabilities found on South-West through West to Northerly aspects above 900 metres. Isolated areas of moderately to weakly bonded windslab will be found in sheltered steeper terrain such as gully exits and around corrie rims. Elsewhere the snowpack will soften but it will remain generally well bonded. Remaining cornices will start to thaw. The avalanche hazard will be Moderate.

Forecast Weather Influences

Light snow showers are possible but the freezing level will rise to above the summits. The strong winds will strengthen slowly throughout the day and veer slightly to the East-South-East.

Comments

Becoming milder, remaining cornices will start to thaw.
