

THE AVALANCHE HAZARD WILL BE CONSIDERABLE

Avalanche Hazard Forecast for Tuesday 30/12/2014

Avalanche Problems

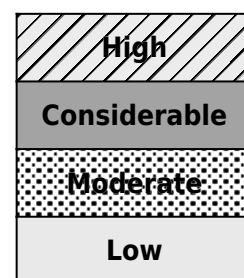

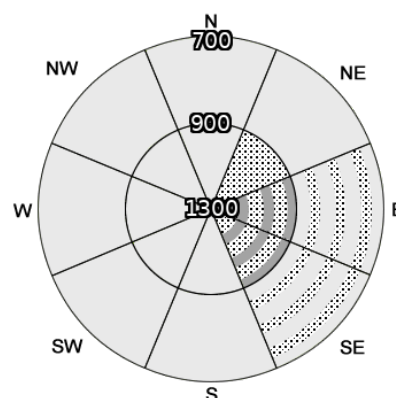

Persistent Weak Layers

Wet Snow

Forecast Snow Stability & Avalanche Hazard

The snowpack will diminish rapidly in the warmer temperatures. Some instabilities will be present in the windslab on mainly East to South-East aspects above 900 metres, but these will largely be confined to the steepest locations where the accumulations are deepest, with steep convex terrain, corrie rims, and gully tops most affected. Elsewhere the snowpack will be moist but generally stable. The avalanche hazard will be Considerable

Forecast Weather Influences

It is expected to be dry throughout the forecast period. Winds will be very strong West-South-Westerly then South-Westerly. Freezing levels will be at summit levels overnight then above summits during the day.

Comments

A warm period is expected, with strong winds for the next few days.
