

THE AVALANCHE HAZARD WILL BE MODERATE

Avalanche Hazard Forecast for Tuesday 06/01/2015

Avalanche Problems

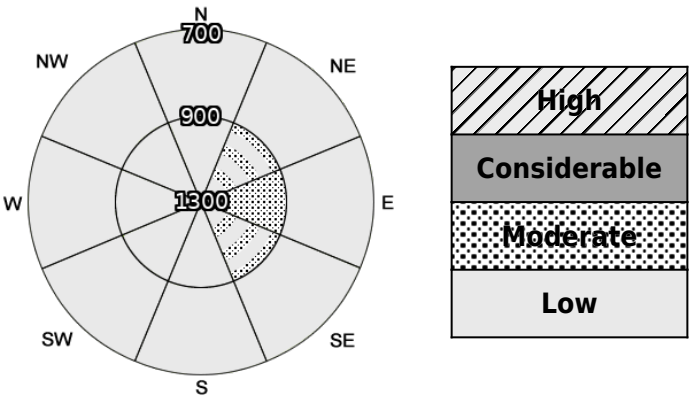

Wind Slab

Cornices

Forecast Snow Stability & Avalanche Hazard

The snowpack that exists on mainly North-East to South-Easterly aspects will remain moist but generally stable, becoming firmer as the temperatures lower. Some localised instabilities will develop in the new windslab on mainly Easterly aspects above 900 metres, with gully tops and corrie rims most affected. Elsewhere the ground will be windswept and bare. Rockfall and cornice collapse will remain a hazard. The avalanche hazard will be Moderate

Forecast Weather Influences

Strong, dry, South-South-Westerly winds overnight. In the early hours precipitation will fall as rain at first to all levels, becoming snow down to 600 metres, this will die out mid morning. Winds will be Westerly then back West-South-Westerly in the afternoon.

Comments

Some snow, with colder temperatures in the day, windy
