

THE AVALANCHE HAZARD WILL BE CONSIDERABLE

Avalanche Hazard Forecast for Saturday 28/02/2015

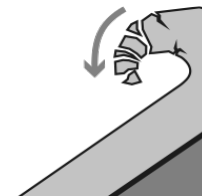

Avalanche Problems

Wind Slab

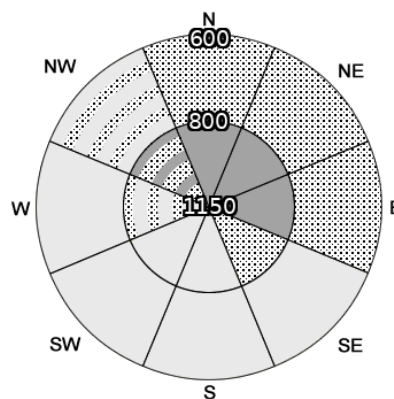

Persistent Weak Layers

Cornices

Forecast Snow Stability & Avalanche Hazard

New rapidly forming unstable windslab will develop mainly on North to East aspects above 800 metres with North-West and South-East aspects also affected due to cross-loading. Stability of newly formed windslab will be poor, particularly on steep terrain such as gullies and scarp slopes where avalanches are likely. Older snow will remain well bonded. Unstable cornices will start to reform. The avalanche hazard will be Considerable.

Forecast Weather Influences

There will be snowfall throughout the forecast period, heaviest overnight and in the afternoon, down to around 650 metres. Winds will be strong, mostly from the South-West, but backing Southerly by the end of the day.

Comments

Heaviest snow overnight and later in the afternoon.
