

THE AVALANCHE HAZARD WILL BE CONSIDERABLE

Avalanche Hazard Forecast for Sunday 27/12/2015

Avalanche Problems

Wind Slab

Persistent Weak Layers

Forecast Snow Stability & Avalanche Hazard

Slopes exposed to recent strong winds will remain scoured and icy at higher elevations. Areas of unstable windslab will exist mainly above 850 meters in sheltered summit gullies and sheltered locations on slopes with West through North to North-Easterly aspect. Gully exits and steeper scarp slopes will be most affected. The avalanche hazard will be Considerable.

Forecast Weather Influences

Some new snow overnight then a return to drier and less windy conditions tomorrow. Winds will be fresh initially South-Westerly backing South-Easterly later. The freezing level will be around 950 metres for much of the day.

Comments

Blustery conditions today but a calmer outlook for tomorrow.
