

THE AVALANCHE HAZARD WILL BE CONSIDERABLE

Avalanche Hazard Forecast for Saturday 06/02/2016

Avalanche Problems

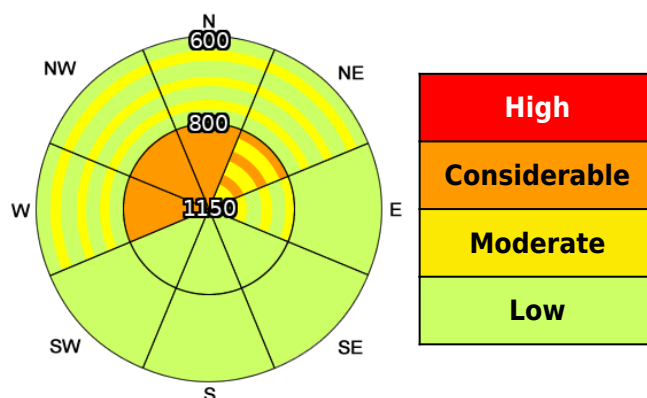

Wind Slab

Persistent Weak Layers

Forecast Snow Stability & Avalanche Hazard

The old, wet snowpack will develop a firm icy crust as cooler conditions develop. Initially new snow amounts will be insignificant. Later, snowfall and drifting snow will form deep, unstable accumulations in sheltered locations on mainly West through North to North-East aspects above 800 metres with cross-loading affecting other sheltered features. Gully exits and corrie rims will be particularly affected. New fragile cornices will develop. The avalanche hazard will be Considerable

Forecast Weather Influences

Light snow in the morning becoming heavier during the afternoon. Strong Westerly winds will veer to the South-East. Freezing level 600 metres overnight, gradually rising to 800 metres by the end of the period.
