

THE AVALANCHE HAZARD WILL BE CONSIDERABLE

Avalanche Hazard Forecast for Saturday 06/02/2016

Avalanche Problems

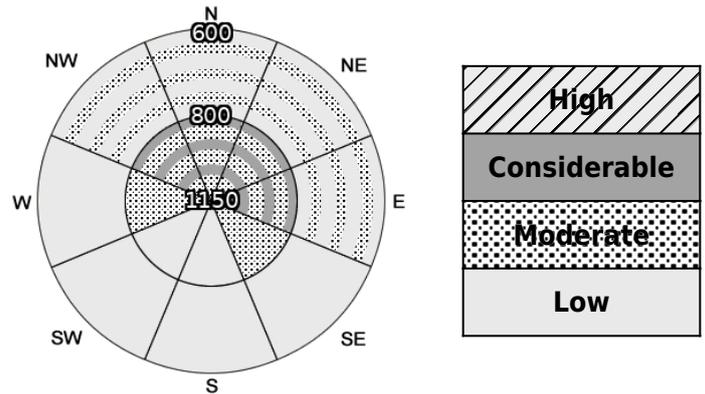

Wind Slab

Persistent Weak Layers

Forecast Snow Stability & Avalanche Hazard

Falling temperatures will continue to consolidate the existing snowpack. Fresh accumulations of unstable windslab will form mainly on North-West through North to East aspects above 800 metres, with gullies and other steep sheltered slopes being most affected. The avalanche hazard will be Considerable.

Forecast Weather Influences

The wind will be strong, initially from a South-West direction backing progressively East-South-Easterly throughout the period. There will be moderate snowfall above 500 metres overnight, rising to 900 metres by the end of the period. The freezing level will be around 500 metres overnight then rising through the day.

Comments

Prospect of colder showery weather bringing more snow.
