Avalanche Hazard Forecast

Issued 06/02/2016

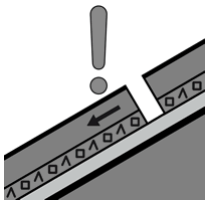
FOR PERIOD 18:00HRS Sat 06/02/2016 TO 18:00HRS Sun 07/02/2016

THE AVALANCHE HAZARD WILL BE CONSIDERABLE

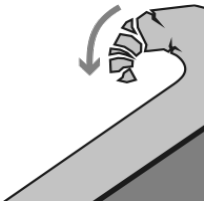
Avalanche Hazard Forecast for Sunday 07/02/2016

Avalanche Problems

Wind Slab



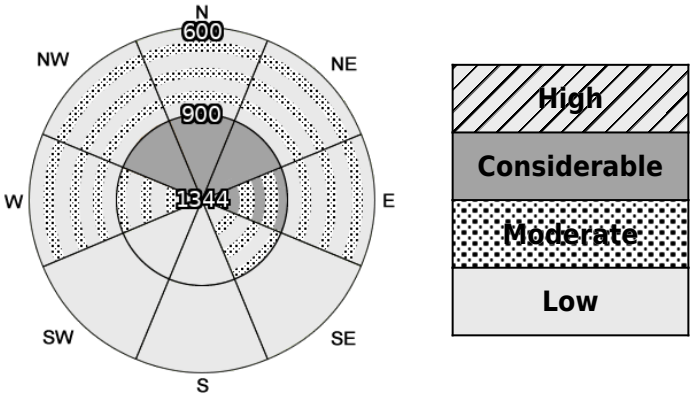
Persistent Weak Layers



Cornices

Forecast Snow Stability & Avalanche Hazard

Fresh unstable windslab will develop with greatest accumulations on North-West through North to East aspects above 900 metres. There will be more localised deposits at lower altitudes, and on other aspects due to crossroading. The older snowpack will be frozen and mainly stable. Fresh soft cornices will build. The avalanche hazard will be Considerable.



Forecast Weather Influences

Strong South-East wind veering West-South-West. Snow showers throughout the period. Freezing level dropping to 600 metres overnight then rising to 800 metres during the day.

Comments

Looking like snow will accumulate on the mountains over the next few days.
