

THE AVALANCHE HAZARD WILL BE CONSIDERABLE

Avalanche Hazard Forecast for Friday 12/02/2016

Avalanche Problems

Wind Slab

Persistent Weak Layers

Forecast Snow Stability & Avalanche Hazard

Some unstable accumulations of windslab will continue to develop on South-West to North-Westerly aspects above 900 metres with coire rims and gully exits most affected. Additionally, some moderate instabilities will persist in localised deep accumulations on Northerly to South-East aspects with steep and convex shaped terrain most affected. Below 900 metres although soft, generally the snowpack is of good stability. The avalanche hazard will be Considerable

Forecast Weather Influences

Light North-East winds overnight slowly veering East-South-Easterly and becoming strong mid afternoon. Dry in the morning with the possibility of light snow in the afternoon . Freezing levels 400 metres or so but snow expected to low levels.

Comments

East winds strengthening from Friday night but remaining cold and wintry.
