

**THE AVALANCHE HAZARD WILL BE CONSIDERABLE**

**Avalanche Hazard Forecast for Saturday 13/02/2016**

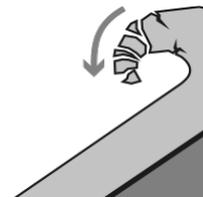

**Avalanche Problems**

Wind Slab

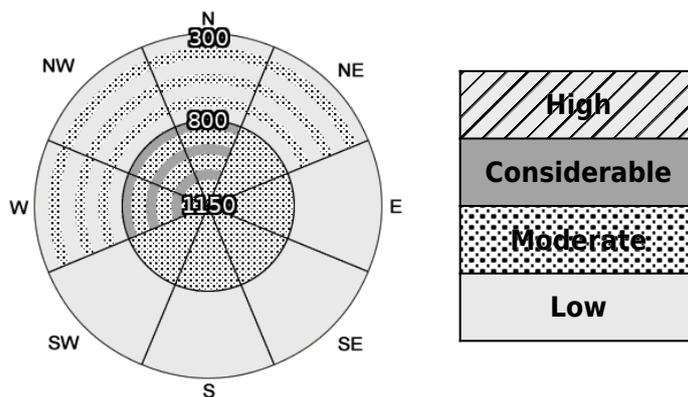

Persistent Weak Layers

Cornices

**Forecast Snow Stability & Avalanche Hazard**

Unstable accumulations of windslab will develop on South-West to North-Westerly aspects mostly above 800 metres with corrie rims and gully exits most affected. Cross loading will affect other aspects with localised unstable deposits. Additionally, some moderate instabilities will persist in older localised accumulations on Northerly to South-Easterly aspects with steep and convex terrain particularly affected. Cornices will be fragile. The avalanche hazard will be Considerable

**Forecast Weather Influences**

Light snow showers overnight, will subside early in the morning to give a predominately dry day. Strong Easterly winds throughout the forecast period these could reach gale force over the summits during the early part of the day. The freezing will lower to 200 metres with a hard frost in the glens.

**Comments**

Looks like a cold, windy Saturday. New snow amounts are not certain.
