

THE AVALANCHE HAZARD WILL BE CONSIDERABLE

Avalanche Hazard Forecast for Saturday 27/02/2016

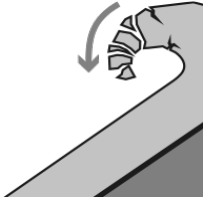

Avalanche Problems

Wind Slab

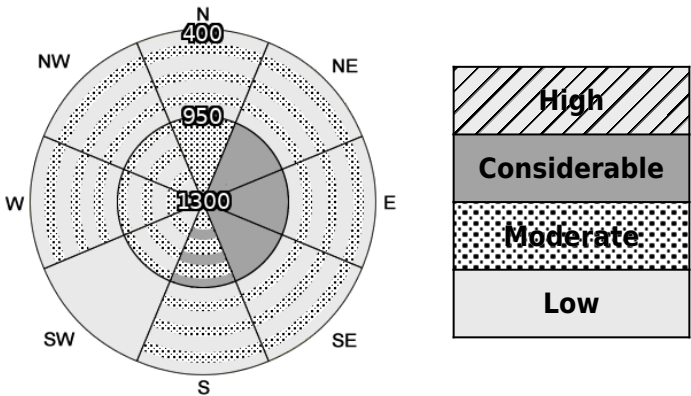

Persistent Weak Layers

Cornices

Forecast Snow Stability & Avalanche Hazard

Poorly bonded snow will persist at depth and within shallow accumulations on North-East to South-East aspects above 950 metres. Steep and convex terrain will be especially affected. Localised windslab is expected to develop mostly around corrie rims and gully tops on West to North aspects. Stability will be generally good at lower levels with localised moderately bonded snow on some steep slopes. Large unstable cornices overhang Easterly aspects. The avalanche hazard will be Considerable

Forecast Weather Influences

Dry settled conditions continuing with light possibly moderate South-East winds backing to the North-East. Freezing at all levels.

Comments

Cold settled conditions expected to continue over the weekend
