Avalanche Problems

Wind Slab

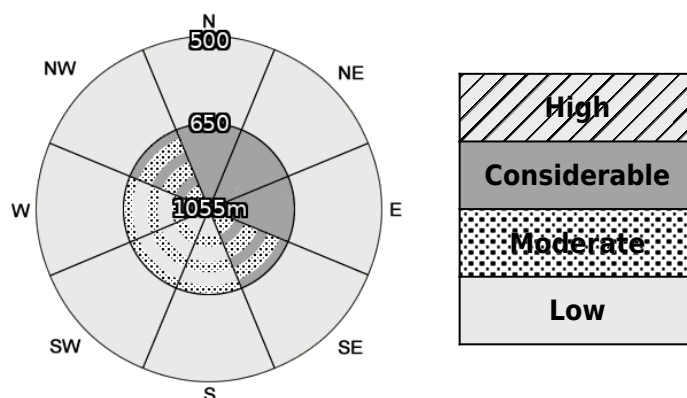

Persistent Weak Layers

Cornices

Forecast Snow Stability & Avalanche Hazard

New accumulations of unstable windslab will develop on North-West through North and East to South - East aspects above 650 metres. Other aspects will be affected due to cross loading with localised instabilities on South to West aspects above 650 metres. The avalanche hazard will be Considerable.

Forecast Weather Influences

The warming period will continue overnight before a cold front will cross the area by dawn. South-South-West winds will be strong to gale force veering West and easing slightly to become strong by the end of the period. Overnight the freezing level will rise to above the summits bringing rain to all levels. As the freezing level drops in the early morning moderate showers will fall as snow on the summits, lowering to around 300 - 400 meters by the end of the day.

Comments

Thawing at all levels, colder condition returning by dawn.
