

THE AVALANCHE HAZARD WILL BE MODERATE

Avalanche Hazard Forecast for Tuesday 05/04/2016

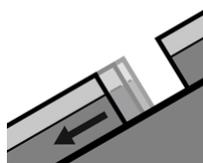

Avalanche Problems

Wind Slab

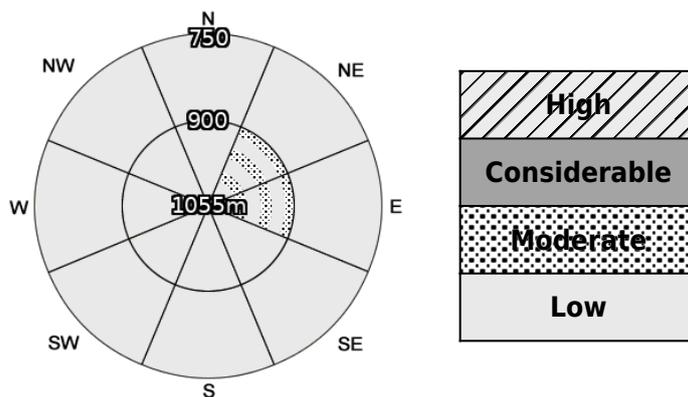

Wet Snow

Gliding Snow

Forecast Snow Stability & Avalanche Hazard

The soft thawing snowpack which remains of North-East to East aspects above 750 metres will remain generally well bonded throughout. New windslab will develop on these aspects above 900 metres. Accumulations are expected to be very localised and mostly confined to corrie rims and gully tops. Some surface sloughs and rock fall are possible on steep slopes. Glide cracks on East slopes will continue to widen due to snow creep. The avalanche hazard will be Moderate

Forecast Weather Influences

Light precipitation throughout the forecast period falling as sleet and snow over the highest summits. Light North-East winds will back to the West and increase to moderate by the end of the day. The freezing level will gradually fall from around 1200 metres to 900 metres by the end of the day.

Comments

Cooler conditions expected later in the week.
