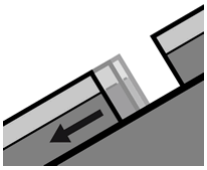
Avalanche Hazard Forecast for Monday 11/04/2016

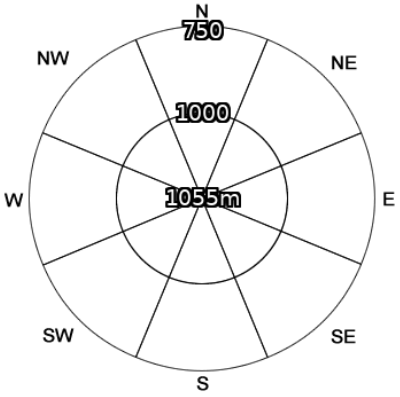
Avalanche Problems

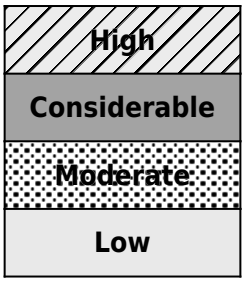


Gliding Snow

Forecast Snow Stability & Avalanche Hazard

Avalanche forecasts have ended in Torridon for the 2015/16 winter season. Isolated snow fields remain on North to East aspects above 750m and will continue to present a slipping and falling hazard if firm and icy. Cornices are a hazard on some slopes, these are unpredictable and prone to collapse if newly formed, as is the potential for full depth avalanches due to snow creep producing Glide cracks in deeper accumulations on steep East facing slopes.





Forecast Weather Influences

Avalanche forecasts have ended in Torridon for the 2015/16 winter season. We recommend that mountain goers venturing into the hills continue to observe weather forecasts prior to their excursions, and visual observations of conditions during their trip. This information is important in making good plans and allowing for flexible decision making when in the mountains and hills.
