

THE AVALANCHE HAZARD WILL BE MODERATE**Avalanche Hazard Forecast for Monday 09/01/2017****Avalanche Problems****Wind Slab****Forecast Snow Stability & Avalanche Hazard**

The old snow will become very firm with new snow mostly falling on bare ground. Localised accumulations will start to develop in wind sheltered locations over existing snow-ice on North-East to South-East aspects above 900 metres. Where new deposits start to acquire depth they will be only moderately bonded to the firm snow-ice base. The avalanche hazard will be Moderate.

**Forecast Weather Influences**

Overnight rain will turn to light snow around dawn as the freezing level drops to around 500 metres. Winds will back from the West-South-West to the South-West during the day.

Comments

Freezing level dropping around dawn.
