Avalanche Hazard Forecast

FOR PERIOD 18:00HRS Thu 02/02/2017 TO 18:00HRS Fri 03/02/2017

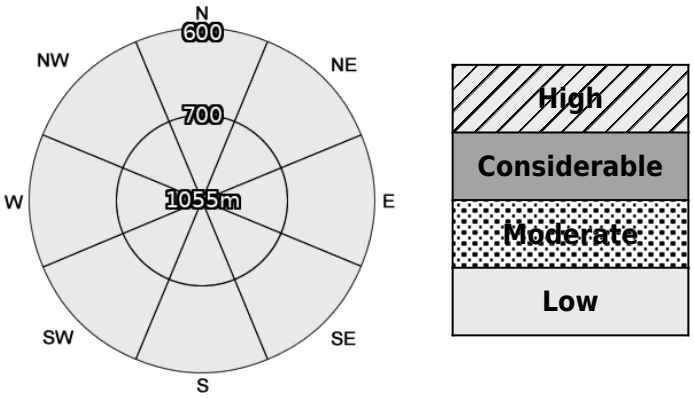
THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Friday 03/02/2017

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

Perhaps a light dusting of fresh snow overnight on the highest summits. Amounts will be insignificant. Otherwise, the very limited and patchy snowpack will remain firm and well bonded, becoming very firm above 800 metres. The avalanche hazard will be Low.



Forecast Weather Influences

After a period of patchy rain pre-dawn, with possibly sleet and snow above 900 metres, it will be a mainly dry and cloudy day. The freezing level will lower to around 800 metres by mid morning and the gale force South-East wind overnight will gradually ease through the day, veering to become a fresh, generally Southerly.

Comments

The snow patches continue to thaw, but becoming colder tomorrow.
