

THE AVALANCHE HAZARD WILL BE CONSIDERABLE

Avalanche Hazard Forecast for Friday 10/02/2017

Avalanche Problems

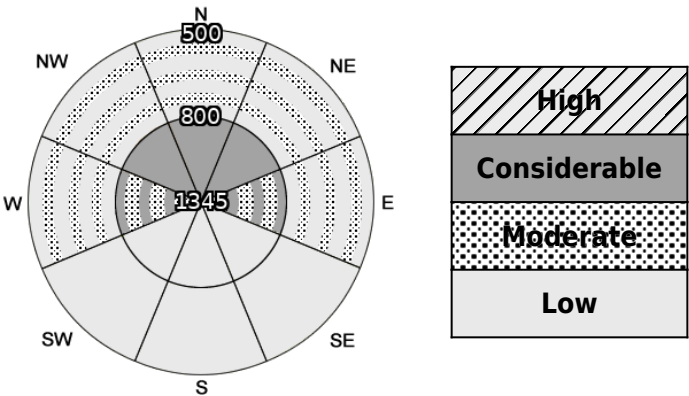

Wind Slab

Persistent Weak Layers

Forecast Snow Stability & Avalanche Hazard

Little change is expected in the snowpack. Areas of windslab will exist in sheltered areas on mainly, but not exclusively, North-West to North-East aspects above 750 metres. The stability of these deposits will be quite varied, with some poorly bonded areas existing. Exposed areas on other aspects will tend to be scoured and will hold little snow. The avalanche hazard will be Considerable.

Forecast Weather Influences

It will remain dry and cold. The freezing level will be around 300 metres. South-Easterly winds will back to the East and ease.

Comments

Although snowpack not extensive with many areas scoured, some unstable deposits do exist.
