

THE AVALANCHE HAZARD WILL BE MODERATE

Avalanche Hazard Forecast for Saturday 25/03/2017

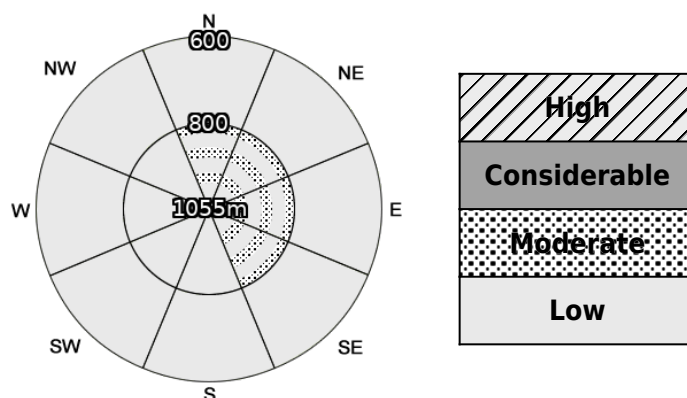

Avalanche Problems

Persistent Weak Layers

Forecast Snow Stability & Avalanche Hazard

The shallow and diminishing snowpack will generally remain well consolidated and stable with the main snowline around 600 metres. However, minor weaknesses will persist in localised areas of windslab, particularly where it gains depth on very steep North through East to South-East aspects and mainly above 800 metres. Elsewhere, many South to West facing slopes and some summits will be bare. The avalanche hazard will be Moderate.

Forecast Weather Influences

A dry and mostly sunny day is expected, perhaps partly cloudy in the morning and mild with the freezing level remaining well above the summits. A fresh, generally South-West wind will persist throughout the period.

Comments

High pressure will dominate with good weather forecasted. The snowpack will continue to consolidate in the milder temperatures.
