

THE AVALANCHE HAZARD WILL BE MODERATE

Avalanche Hazard Forecast for Monday 08/01/2018

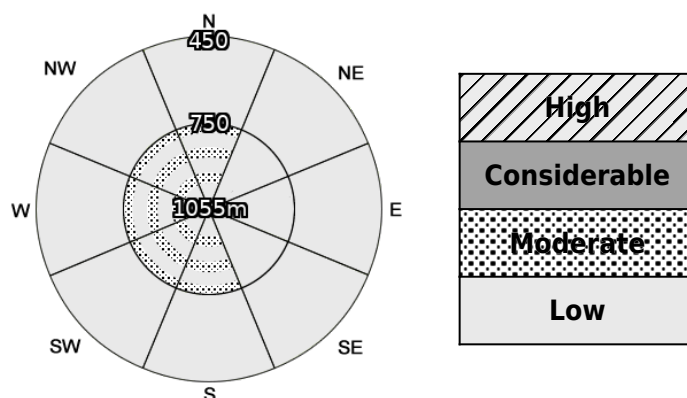

Avalanche Problems

Persistent Weak Layers

Forecast Snow Stability & Avalanche Hazard

Little change is expected and the snowpack will remain generally stable. However, very localised pockets of moderately well bonded windslab will persist, mainly South, through West to North aspects above 750 metres. Most affected will be steep slopes, particularly gully exits, coire rims and scarp slopes, The avalanche hazard will be Moderate.

Forecast Weather Influences

Remaining dry and cloudy, broken at times. The fresh South wind will strengthen through the day, backing East-South-East. Although it will be freezing in the glens, the main freezing level will fluctuate between 400 and 600 metres.

Comments

Neve and icy paths at lower levels, breakable crust at mid level and soft snow on the summits. Good winter conditions! High windchill on exposed summits and ridges.
