Forecast Snow Stability & Avalanche Hazard

There will be a period of instability overnight as the freezing level rises and the snowpack becomes wet. The cooler temperatures later in the night will consolidate the existing snowpack. However, fresh areas of unstable windslab will build on North through East to South-East aspects above 800 metres through the day. The avalanche hazard will be Considerable.

Forecast Weather Influences

Early in the night the freezing level will rise above the summits. Later in the night it will drop below summit level, and will continue decreasing through the day to around 300 metres. Overnight rain will clear to showers which will fall as snow to progressively lower levels. Winds will be from the West-South-West.

Comments

A stormy period of weather expected over the next few days.
