

THE AVALANCHE HAZARD WILL BE CONSIDERABLE**Avalanche Hazard Forecast for Tuesday 06/02/2018****Avalanche Problems****Wind Slab****Persistent Weak Layers****Forecast Snow Stability & Avalanche Hazard**

The cold, dry, light deposits will drift easily in the fresh and strong winds. Windslab will form initially on North-West to North-East aspects. In the early hours, accumulations of unstable windslab on East to South aspects will form. Localised accumulations of deeper moderate to poorly bonded windslab will develop in steeper, wind sheltered locations on East and South-East aspects above 850 metres. Fragile cornices will form. The avalanche hazard will be Considerable.

**Forecast Weather Influences**

Overnight light to moderate snowfall will ease to give just a trace of snow during daylight hours, before returning to light snowfall at the end of the forecast period. Winds will be initially strong South-South-Westerly decreasing and veering to fresh West-North-Westerly. It will be very cold with the freezing level lowering to 200 metres during the day with minus seven degrees centigrade at 950 metres in the morning.
