

THE AVALANCHE HAZARD WILL BE MODERATE

Avalanche Hazard Forecast for Monday 19/03/2018

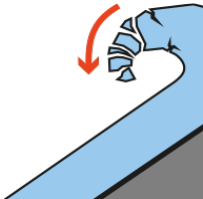

Avalanche Problems

Wind Slab

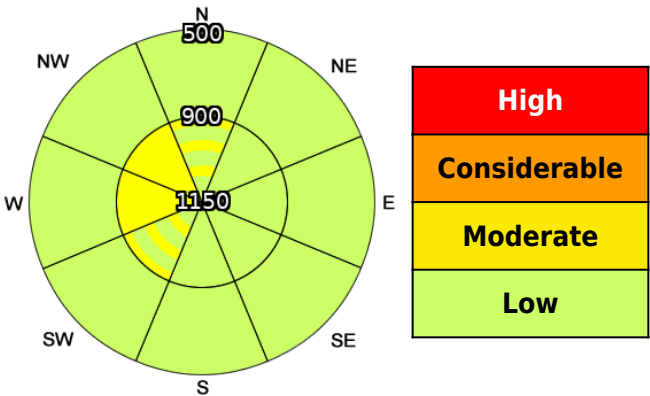

Persistent Weak Layers

Cornices

Forecast Snow Stability & Avalanche Hazard

The snowpack will be generally firm and stable in most areas especially where slopes have been exposed to the wind. Localised areas of moderate to poorly bonded windslab will be present on mostly West to Northerly aspects above 900 metres with steep wind sheltered places below ridge crests, coire rims and gully exits most affected. Some deposits due to cross loading will also be on Southerly aspects. The avalanche hazard will be Moderate.

Forecast Weather Influences

A dry day is expected, winds will be strong Easterly overnight backing and decreasing in strength to become North-East to Northerly during the day. Freezing at all levels at first rising to 600m through the day.

Comments

A sunny day in prospect remaining wintry.
