

THE AVALANCHE HAZARD WILL BE MODERATE

Avalanche Hazard Forecast for Friday 08/02/2019

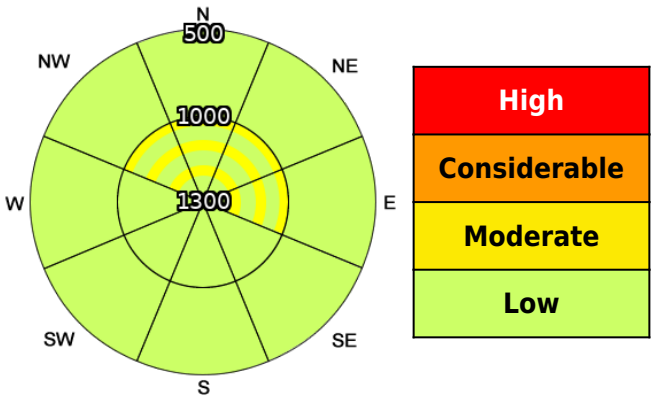

Avalanche Problems

Wind Slab

Forecast Snow Stability & Avalanche Hazard

The existing snowpack and snow accumulations on mainly North-West to Northerly aspects mostly above 1000 metres will consolidate in the fluctuating temperatures. Later, some additional new localised moderately well-bonded deposits of fresh snow will build in wind sheltered places on North-West to North-Easterly aspects above 1000 metres, gully exits and coire rims will be most affected but amounts are not expected to be great. The avalanche hazard will be Moderate.

Forecast Weather Influences

Moderate strength winds overnight will increase in strength to storm force Southerly by morning. Freezing levels at 700 metres in the evening will rise to well above the summits by midday before lowering to 1000 metres by the end of the forecast period. Snow at first above 700 metres before turning to rain, then heavy sleet and snow at summit levels, then snow above 900 metres as it gets colder from mid-afternoon.

Comments

A very windy day in prospect with storm force winds,
