

THE AVALANCHE HAZARD WILL BE CONSIDERABLE

Avalanche Hazard Forecast for Wednesday 20/02/2019

Avalanche Problems

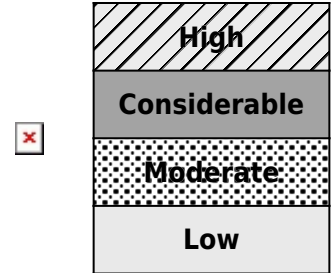

Wet Snow

Cornices

Forecast Snow Stability & Avalanche Hazard

Heavy overnight rain will saturate the snowpack giving a period of higher instability. Drier conditions later will allow a degree of stabilisation to occur. Wet snow instabilities will exist in sheltered gullies and on slopes with a North-West through North to Easterly aspect mainly above 900 metres. Cornices will be prone to collapse. The avalanche hazard will be Considerable.

Forecast Weather Influences

Heavy rain overnight and into the morning will affect the area. The freezing level will rise well above the summits. Winds will be strong Southerly overnight veering South-Westerly remaining strong through the day.

Comments

Small slough/ class 1 area of avalanche debris noted below a North-Easterly aspect from 1000 metres. Hazard of rockfall will exist during the wet and mild conditions expected.
