

THE AVALANCHE HAZARD WILL BE MODERATE**Avalanche Hazard Forecast for Sunday 03/03/2019****Avalanche Problems****Wind Slab****Forecast Snow Stability & Avalanche Hazard**

The old snow patches will become firm and icy. Persistent drifting will form localised accumulations of windslab in wind sheltered areas on North-West through North to East aspects above 1000 metres. These new deposits will be unstable where they achieve significant depth, especially where they overlie old snow-ice. Most likely locations for this situation to occur will be in gully exits and around corrie rims. The avalanche hazard will be Moderate.

**Forecast Weather Influences**

Light precipitation overnight continuing through until early afternoon, falling as rain and sleet at first, quickly turning to snow in the mountains as the freezing level lowers to around 800 metres. Gale force South-Westerly winds overnight and during the morning, easing through the afternoon.

Comments

A definite return to winter weather with snowfall and very strong winds. Old snow patches will become very icy.
