

THE AVALANCHE HAZARD WILL BE MODERATE

Avalanche Hazard Forecast for Friday 08/03/2019

Avalanche Problems

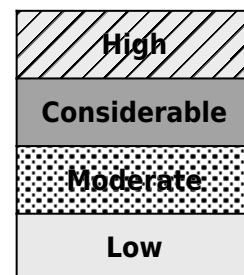

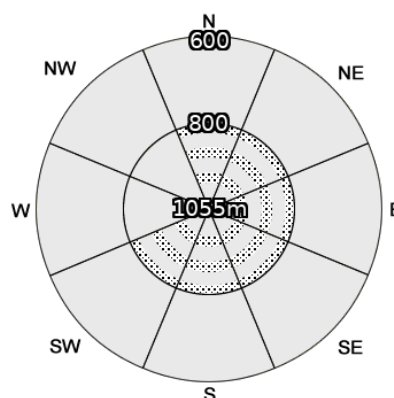

Wind Slab

Persistent Weak Layers

Forecast Snow Stability & Avalanche Hazard

Some general consolidation of the snowpack will occur overnight, but shallow instabilities will remain in isolated pockets of windslab, on steep slopes above 850 metres, South-East to South-West aspects. Additionally, fresh windslab will develop through the day on localised steep sheltered slopes, on mainly North to East aspects above 800 metres. The avalanche hazard will be Moderate.

Forecast Weather Influences

Dry overnight with the fresh Northerly wind becoming light and backing South, strengthening by daybreak as more rain arrives, persisting through the day, falling as snow above 400 metres initially, above 650 metres later as the freezing level rises to 700 metres by the end of the period.

Comments

Remaining unsettled with periods of summit snow showers and strong winds developing.
