Avalanche Problems

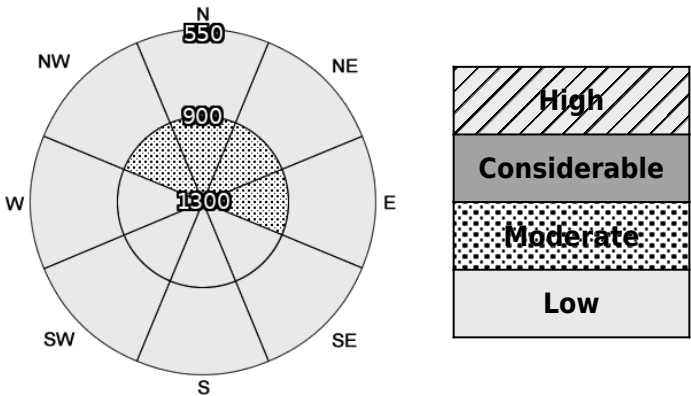

Wind Slab

Cornices

Forecast Snow Stability & Avalanche Hazard

Moderately bonded wind slab will continue to develop on North-West, through North to Easterly aspects above 900 Metres. These will be located in steep sheltered areas such as corrie rims, headwalls, crag aprons and gully exits. Localised moderately bonded windslab will develop on West aspects due to cross loading above 900 Metres. The avalanche hazard will be Moderate.

Forecast Weather Influences

No precipitation is expected for the duration of the forecast period. Winds will be South-Westerly backing through Southerly to South-Easterly. Moderate increasing to strong through the day. The freezing level will be 800 metres before gradually rising to above the summits at the end of the day.

Comments

A dry, sunny and windy day expected tomorrow, before a warmer spell later in the week.
