THE AVALANCHE HAZARD WILL BE MODERATE

Avalanche Hazard Forecast for Tuesday 14/01/2020

Avalanche Problems

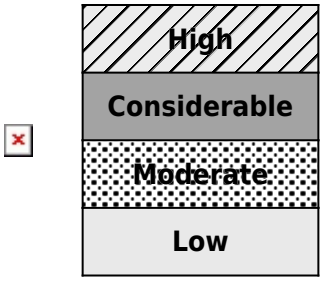

Wind Slab

Cornices

Forecast Snow Stability & Avalanche Hazard

New weakly bonded windslab will continue to develop with greatest accumulations forming on steep wind sheltered locations mainly on North-West through North to East aspects above 800 metres. Sheltered areas such as coire headwalls, ridge flanks and gully exits will be particularly affected. Other slope aspects will also be affected due to cross loading. Windward slopes scoured. Cornices will be fragile. The avalanche hazard will be Moderate.

Forecast Weather Influences

Remaining cold, freezing around 400 metres. Snow showers continuing through the period with very strong South-Westerly winds.

Comments

Remaining generally cold with further snow showers these heavy at times falling to lower elevations with very strong winds.
