

THE AVALANCHE HAZARD WILL BE MODERATE

Avalanche Hazard Forecast for Saturday 14/03/2020

Avalanche Problems

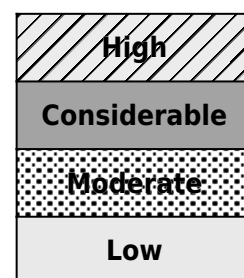

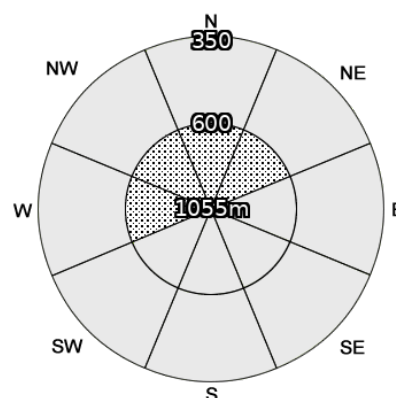

Wind Slab

Cornices

Forecast Snow Stability & Avalanche Hazard

Areas of fresh, moderately bonded windslab will continue to accumulate in steep sheltered locations, mainly above 600 metres overnight, above 750 metres through the day. Areas most affected will be West through North to North-East aspects, most notably in gullies, on scarp slopes, coire rims and ridge flanks. New cornice growth expected above these locations. Elsewhere, the snowpack will continue to consolidate. The avalanche hazard will be Moderate.

Forecast Weather Influences

Overnight snow will ease into showers through the day, wintry above 700 metres. The fresh to strong South-East wind will veer generally Southerly by daybreak and the freezing level is expected to rise from an overnight low of 400 metres to 800 metres through the day.

Comments

Good snow cover above 350 metres. A rising freezing level tomorrow will help consolidate the snowpack at lower elevations. Remaining unsettled, but with periods of snow at higher elevations.
