Cornices

Forecast Snow Stability & Avalanche Hazard

Unstable windslab mainly on North-West to North aspects above 1000 metres. Areas most affected will be on steep and convex terrain, gully tops, coire rims and crag aprons. More localised instabilities on West and North-East aspects due to cross loading. During the day as the freezing level rises the snowpack will begin to consolidate. Below 1000 metres and on other aspects the snowpack will remain well bonded and stable. The avalanche hazard will be Considerable.

Forecast Weather Influences

Some snowfall is expected above 1000 metres mainly during the night, this will turn to occasional light sleet and rain as the freezing level rises to the highest summits during the day. Strong to gale force South-South-East winds will back to the South-East and ease to strong.

Comments

Breakable crust continues to be a hazard if your on ski.
