

THE AVALANCHE HAZARD WILL BE MODERATE

Avalanche Hazard Forecast for Saturday 12/12/2020

Avalanche Problems

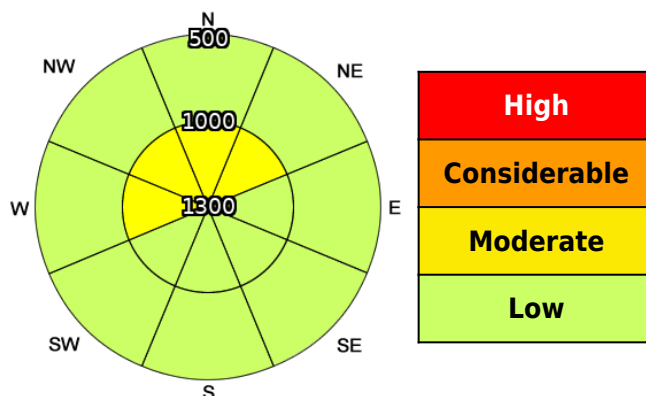

Wind Slab

Cornices

Forecast Snow Stability & Avalanche Hazard

The old snowpack will continue to consolidate; however localised instabilities will persist in steep and convex locations on West through North to North-East aspects mainly above 1000 metres. Areas especially affected will be below coire rims, the tops of gullies and crag aprons. New isolated accumulations of windslab will develop on Northerly aspects at the highest levels. The avalanche hazard will be Moderate.

Forecast Weather Influences

Drizzle at all levels will turn to light snow at summit levels during the day. Strong South-Easterly winds will ease through the day to become light Southerly during the afternoon. The freezing level will be above the summits before lowering to 1100 metres through the afternoon.

Comments

Turning calmer and a little cooler through Saturday afternoon.
