

THE AVALANCHE HAZARD WILL BE MODERATE**Avalanche Hazard Forecast for Tuesday 23/02/2021****Avalanche Problems****Wind Slab****Wet Snow****Cornices****Forecast Snow Stability & Avalanche Hazard**

Accumulations of fresh unstable windslab will build rapidly during the early morning, steep wind sheltered locations on North-West to North-East aspects above 900m will be most affected. In the same locations wet snow instabilities will develop from mid morning onwards as precipitation turns to rain. Wind exposed locations will remain well bonded and stable. The snowpack will thaw and diminish at all elevations as the day progresses. The avalanche hazard will be Moderate.

**Forecast Weather Influences**

After a dry night, heavy showers will start early morning and continue for most of the day. These will initially be snow above 700 metres, gradually turning to rain at all levels. Moderate Southerly winds will gradually increase to very strong and veer South-South-East by morning then ease slightly during the day. The freezing level will initially be around 700 metres rising above the summits by mid morning.

Comments

A very stormy day tomorrow, with a significant thaw in the afternoon. Wednesday is slightly colder but remaining windy.
