

THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Wednesday 24/02/2021

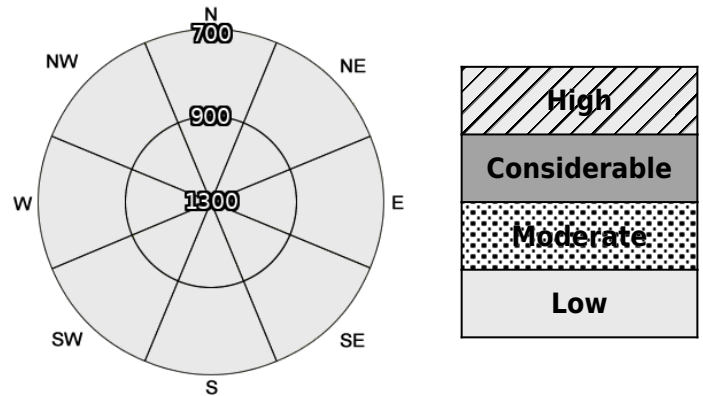

Avalanche Problems

Wet Snow

Forecast Snow Stability & Avalanche Hazard

The snowpack will continue to thaw and remain well bonded and stable in most locations. Isolated wet snow instabilities will be present in some steep windsheltered locations on North-West to North-East aspects above 1000 metres, particularly overnight Tuesday. Any new snow accumulations that develop on the highest summits, during the day, are not expected to be significant. The snowpack will start to refreeze above 1000 metres during the afternoon. The avalanche hazard will be Low.

Forecast Weather Influences

Precipitation will fall as rain at all levels during the night, turning to snow only on the highest summits as showers become lighter during the morning. The afternoon will be dry. The freezing level will be well above the summits overnight falling to around 1300m during the morning and 1000m by the end of the afternoon. Winds will be very strong South-South-Westerly.

Comments

A colder day on Thursday but remaining windy.
