

THE AVALANCHE HAZARD WILL BE LOW**Avalanche Hazard Forecast for Tuesday 09/03/2021****Avalanche Problems****Wet Snow****Forecast Snow Stability & Avalanche Hazard**

Windslab accumulations above 1000 metres on specific North-East to South-East aspects will consolidate and improve in stability. On these aspects there may be the potential for wet snow instabilities on the steepest of slopes. Elsewhere the snowpack will remain well bonded and stable. The avalanche hazard will be Low.

**Forecast Weather Influences**

Winds will be light South-South-Westerly overnight, backing to Southerly during the day. The wind will strengthen continuously through the day to gale force by late afternoon. It is forecast to be mostly dry with the potential for snowfall towards the end of the day. The freezing levels will remain around the summits.

Comments

Poor visibility and winds increasing to gale force will give challenging mountain conditions during tomorrow afternoon. Firm icy conditions on steep shaded slopes with serious run out potential.
