

THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Wednesday 29/12/2021

Avalanche Problems

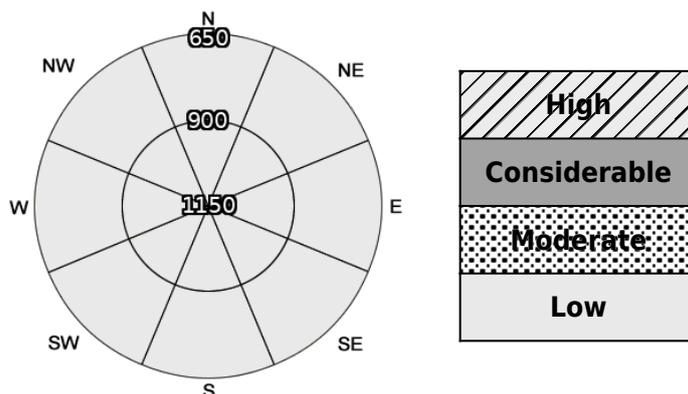

Wet Snow

Cornices

Forecast Snow Stability & Avalanche Hazard

Any new snow amounts are not expected to be significant. The shallow snowpack will become moist as rain affects the area leading some isolated surface wet snow instabilities. Most affected locations will be above 900 metres on steep wind sheltered locations, such as coire rims, gully tops and scarp slopes with a North-West through North to East aspect. Any remaining cornices will be prone to collapse. The avalanche hazard will be Low.

Forecast Weather Influences

Overnight, remaining cold then the freezing level will rise above all summits. Mainly dry through to dawn then some snow showers for a short period in the morning these will turn to rain at all levels through the afternoon. The light Southerly winds will strengthen becoming East-South-Easterly before returning to South-West at the end of the period.

Comments

Becoming milder with mainly rain through Wednesday.
