

THE AVALANCHE HAZARD WILL BE MODERATE

Avalanche Hazard Forecast for Wednesday 05/01/2022

Avalanche Problems

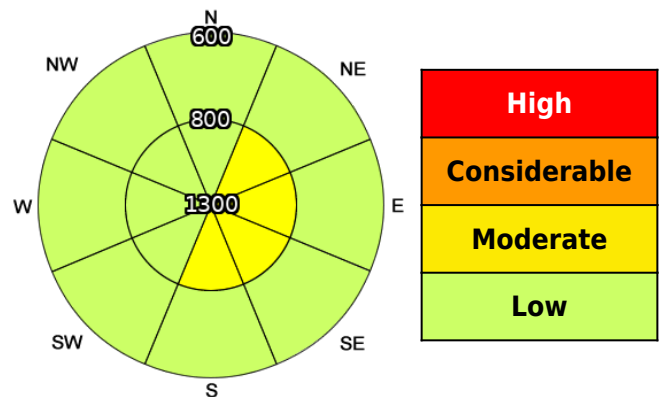

Wind Slab

Cornices

Forecast Snow Stability & Avalanche Hazard

A combination of new snow and the redistribution of existing snow will result in the continual development of unstable windslab on North-East through East to South aspects above 800 metres. Other aspects will be affected due to cross loading. Greatest instabilities will be around corrie rims, gully exits and crag aprons. Fragile cornices will continue to develop. The avalanche hazard will be Moderate.

Forecast Weather Influences

Gale force North-Westerly winds will gradually ease strong to moderate during the day. Snow showers will become scattered overnight, finally clearing away by dawn. The freezing level will be around 400 metres.

Comments

More snow at lower levels than expected. Relatively calm at lower elevations, but unpleasant above 800 metres with drifting snow.
