Wet Snow

Cornices

Forecast Snow Stability & Avalanche Hazard

After an initial period of wet snow instability on steep North-West through North to East aspects above 900 metres, the snowpack will start to refreeze and stabilise. On these aspects in steep isolated areas some instabilities will persist at depth but these will be mostly protected by the strong upper layers. The avalanche hazard will be Low.

Forecast Weather Influences

Strong winds from a general West-South-Westerly direction are forecasted. Insignificant amounts of rain will gradually turn to light snow for a short period. The freezing level will lower to around 800 metres in the early hours where it will remain for the rest of the forecast period.

Comments

A noticeable rise in temperatures resulting in an obvious loss of snow, especially at lower elevations.
