

THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Friday 14/01/2022

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

The snowpack will remain well bonded and stable throughout. Greatest accumulations will be on North-West through North to East facing coire back walls, ridge flanks and plateau areas above 900 metres. Below this altitude the ground will be mostly bare with ribbons of soft stable snow remaining in areas such as shallow gullies and steep banks. The avalanche hazard will be Low.

Forecast Weather Influences

Remaining mild with freezing levels above the summits for the duration of the forecast period. Strong to gale force Westerly winds will gradually decrease through the night, to become light South-Westerly in direction during the day. Apart from hill fog and mist no precipitation is expected.

Comments

Serious runout potential where firm snow remains of steep slopes. Rockfall a potential hazard during the thaw conditions.
