Southern Cairngorms

Issued 18/01/2022

Avalanche Hazard Forecast

FOR PERIOD 18:00HRS Tue 18/01/2022 TO 18:00HRS Wed 19/01/2022

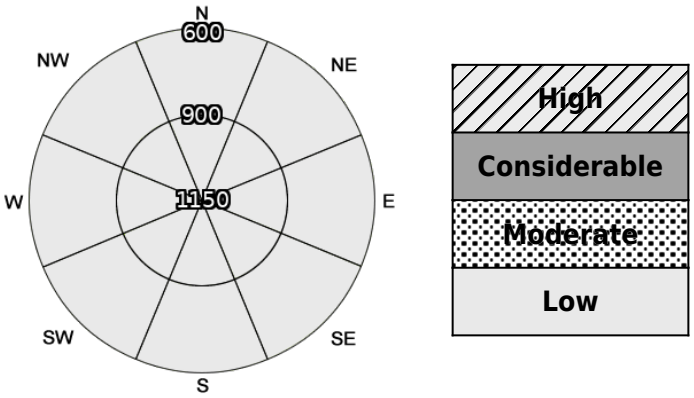

THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Wednesday 19/01/2022

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

There will be no change to the current situation with well bonded, patchy snow present. A superficial thin layer of new snow will be present at the highest elevations with some inconsequential accumulations developing. Largest areas of snow will be encountered in the high North and East facing corries above 900 metres. The avalanche hazard will be Low.

Forecast Weather Influences

Light overnight rain will turn to sleet and then snow as the freezing level lowers to around 650 metres by daylight. Only a trace of new snow is expected with no precipitation forecast for the majority of the day. Strong South-Westerly winds veering North-North-Westerly by the end of the period.

Comments

Slightly more snow expected along the Northern boundary of the forecast area than in the East and South.
