Avalanche Hazard Forecast

FOR PERIOD 18:00HRS Sat 22/01/2022 TO 18:00HRS Sun 23/01/2022

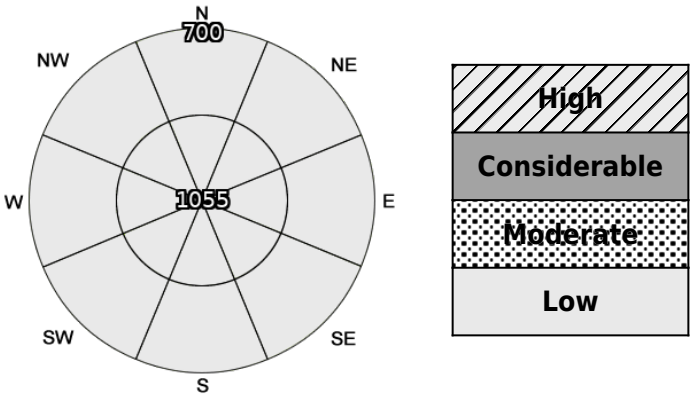

THE AVALANCHE HAZARD WILL BE LOW

Avalanche Hazard Forecast for Sunday 23/01/2022

Avalanche Problems

Forecast Snow Stability & Avalanche Hazard

The few remaining patches of old snow will be well consolidated and stable and continue to gradually thaw at most elevations. These snow patches are most likely to be found around coire rims and in gullies on North to East aspects above 850 metres. Any new snow amounts on the highest summits are likely to be very small and are not expected to be significant. The avalanche hazard will be Low.

Forecast Weather Influences

A day of constant light precipitation which will be rain at most levels possibly turning to snow on the highest summits for a time. The freezing level will be around 1000 metres. Winds will be very strong South-Westerly.

Comments

Slightly colder with some summit snow on Monday.
